

KOSTOVIC / TESLA ELECTRIC ENGINE

For the past thirty years I have conducted research on several projects in connection with different types of wireless released electricity. The achieved knowledge has led me to invent a new eco electric fuel. Kostovic/Tesla electric engine – a minimized mobile electric power station utilizes eco electric fuel. The rising cost of fossil fuels and needs for saving energy have led me to develop the technology of a new eco electric fuel as a replacement for fossil fuels. This technology will be great contribution to the environmental protection from pollution caused by emitted carbon dioxide in atmosphere.

The Kostovic/Tesla electric engine produces electricity as an independent unit through electrical and chemical processes. These processes do not cause any pollution in the atmosphere. The electric engine - a minimized mobile electric power station is an effective and absolute replacement for all kind of engines that run on gas and crude oil. The project is based on invented and successfully achieved new technologies of wireless released electricity through two energetic fields.

The clue in this process of wireless released electricity is a special form of electromagnetic induction where the positrons, the electron cells and the neutron cells are wrapped with ionized air under pressure. Thus enriched positrons, neutrons, and electron cells produce an endless sequence of oscillation waves of wireless released electricity. It is successfully achieved that enriched electrons, positrons and neutron cells became new electron cells of eco electric fuel. New electron cells mutually attract and interact in the oscillation waves of electromagnetic induction without the possibility of invalidating each other and with no possibility to escape from the system.

New electron cells from the wireless released electricity interact with emitted high-frequency oscillations. High-frequency oscillations are the conductor and catalyst in the process of production of electron cells of wireless released electricity. This energetic process of wireless released electricity in the mobile chamber - unit of electromagnetic induction of Part II frees electron cells from the transformers, different chemical compounds and special minerals. This is one form of electromagnetic induction with huge electromagnetic motive force, under absolute control. Freed electron cells create a new fuel called eco electric fuel.

Additionally, the eco electric fuel is converted in an alternative current by wire and through the copper plates placed on the exit in the chamber of Part II, constantly supply Tesla induction motor or any other electromotor. Tesla induction motor or any other electromotor is constantly supplied with alternating current by wire from electrical increase power mechanical apparatuses. This is novel system of wireless released electricity in the production of eco electric fuel in minimized mobile chamber - unit of electromagnetic induction of Part II.

Alternating current from the mobile chamber - unit of electromagnetic induction is distributed by wire to each electrical apparatus in the system. As the back up batteries are constantly supplied with electric current from the Tesla induction motor or any other

electromotor these batteries will never explode. The electronic protection for batteries can be used for safety reasons, although these batteries cannot be overcharged or drop in voltage.

The electricity produced in this fashion of special form of electromagnetic induction has more powerful energetic characteristics than fossil fuels. There is no limit for increasing the power from one hundred to hundreds of thousands of KW. Eco electric fuel is clean, a lot cheaper, more effective, and more lasting than fossil fuel and will become the absolute replacement for fossil fuels.

The K/T Electric Engine is a minimized mobile electric power station (this machine can be produced in any size) that can be made for any type of electrical consumer. It can be placed in different types of military equipment, any size and type of military or civil vehicle, vessel, air crafts, plants, hospitals, industrial application, agriculture, forestry, manufacturing, mining, telecommunications, data centers, etc. This novel system does not release poison gas or CO₂ into the atmosphere, and it will be a great contribution to environmental protection as well as a reduction on the effect of pollution. The first prototype of the K/T electric engine has been successfully completed. Several different prototypes of the K/T electric engine will be available through the year 2008/2009.

The Kostovic/Tesla Electric Engine is a powerful and durable independent unit. There is no limit to the production of different types of these engines. The K/T Electric Engine produce electricity as an independent unit through electrical and chemical processes. These electrical and chemical processes do not cause any pollution in the atmosphere.
